
Shaded row: S11 absolute coefficient map. Remaining rows: fixed specification differences.
RMS computed within each participant after equal averaging of all four run maps; RMS has no sign.
BOLD is percent-scaled; gain/loss use monetary units. Coefficients depend on the fixed SPM impulse basis (oversampling 50), not peak response amplitude.
Points and bars copy saved participant means and uncorrected t95 intervals; no new inference.
One common support: 37,607 voxels. Numerically valid support approved after input failures. Saved design-quality failures: 463 run/arm combinations.
