All-band prediction misses practical margins and complementarity checks

A: primary 0.000672 < 0.010; identity 0.001380 < 0.005. Both practical gates and all 5 complementarity screens FAIL.

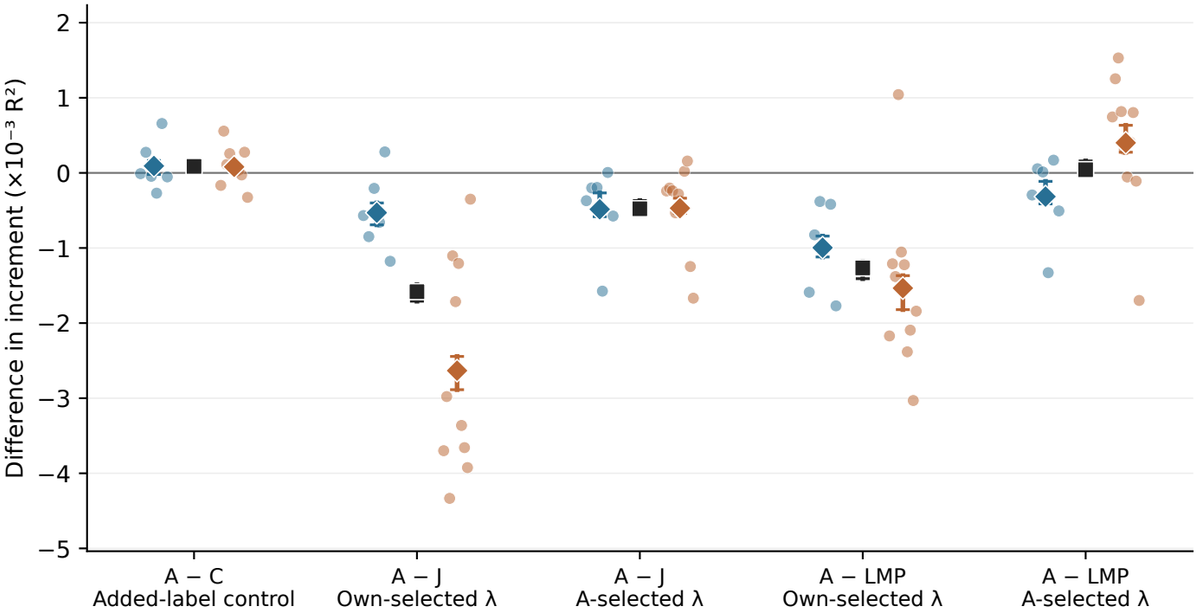

A Primary: improvement over direction/time baseline

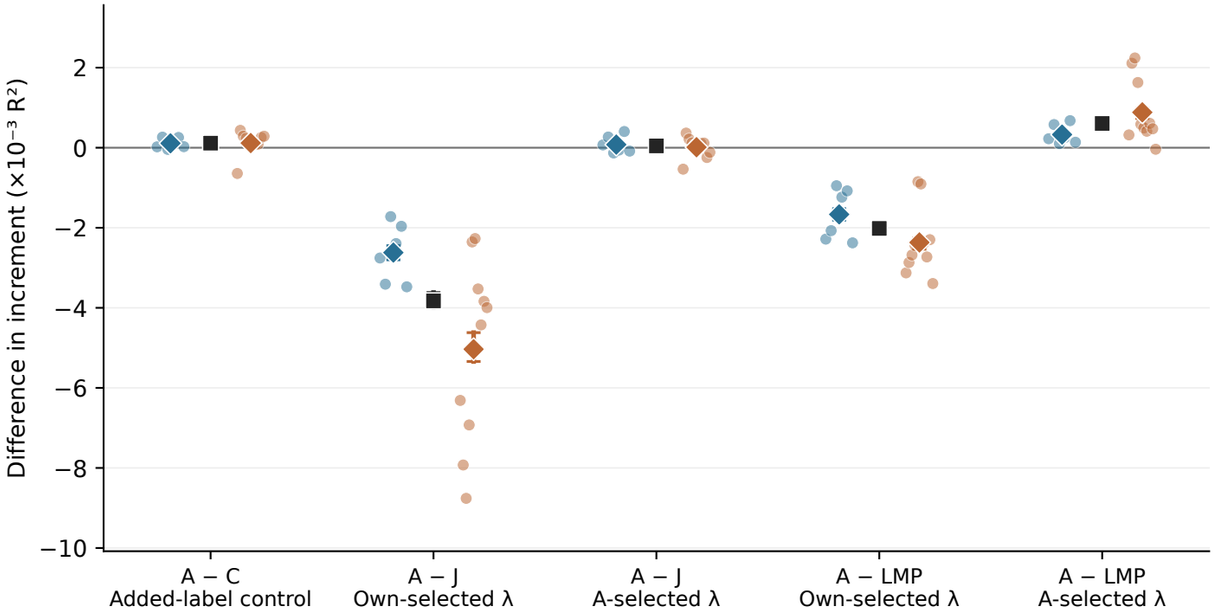

B Identity: correct versus wrong held-out trial pairing

C Primary contrasts: all-band minus comparator

D Identity contrasts: all-band minus comparator

◆ Mihili mean ◆ Chewie mean ■ Equal-animal mean

Small dots: all 16 sessions per group. Bars: fixed-prediction session-omission ranges; not confidence intervals. All axes retain signed values.
J = LMP + 100–400 Hz; A adds all six remaining stored power bands. C permutes only the added training block within direction; evaluation stays intact.
A selects λ = 10 in all 16 sessions; C uses the same λ. Own-selected anchors keep their original λ; matched anchors use A-selected λ.
A/C share feature width, trace and λ, but their covariance spectra and effective degrees of freedom differ. Exposed development data · 2 animals · no promotion.
