Current/history blend: higher primary gain, lower identity gain than HW

Blend primary 0.002679 < 0.010; identity 0.004559 < 0.005. Both practical margins fail.

Other 15 sessions select λ=1 and α=0.5 in every outer fold; W/HW anchors also select λ=1. No neural refits.

Blend's own animal/omission gains stay positive. Against HW, only 3/10 Chewie sessions improve; omitting June 30 makes its mean −0.00000305.

Small dots: all 16 sessions. Diamonds/squares: animal/equal-animal means. Bars: fixed-prediction session-omission ranges, not confidence intervals.
Each row shares a vertical scale; direct contrasts use a common symmetric scale and retain every signed effect. Identity falls versus HW in both animals.
W uses current LMP; HW uses four LMP bins with the same current-bin repeatability prior. The blend intentionally averages their predicted trajectories.
Scores use identical native XY targets, B and denominators. Independent and blend-λ-matched anchor contrasts coincide here. Omission scores do not refit.
Exposed development data · 2 animals · source/target support unchanged · improved search incumbent does not imply eligibility or promotion.
