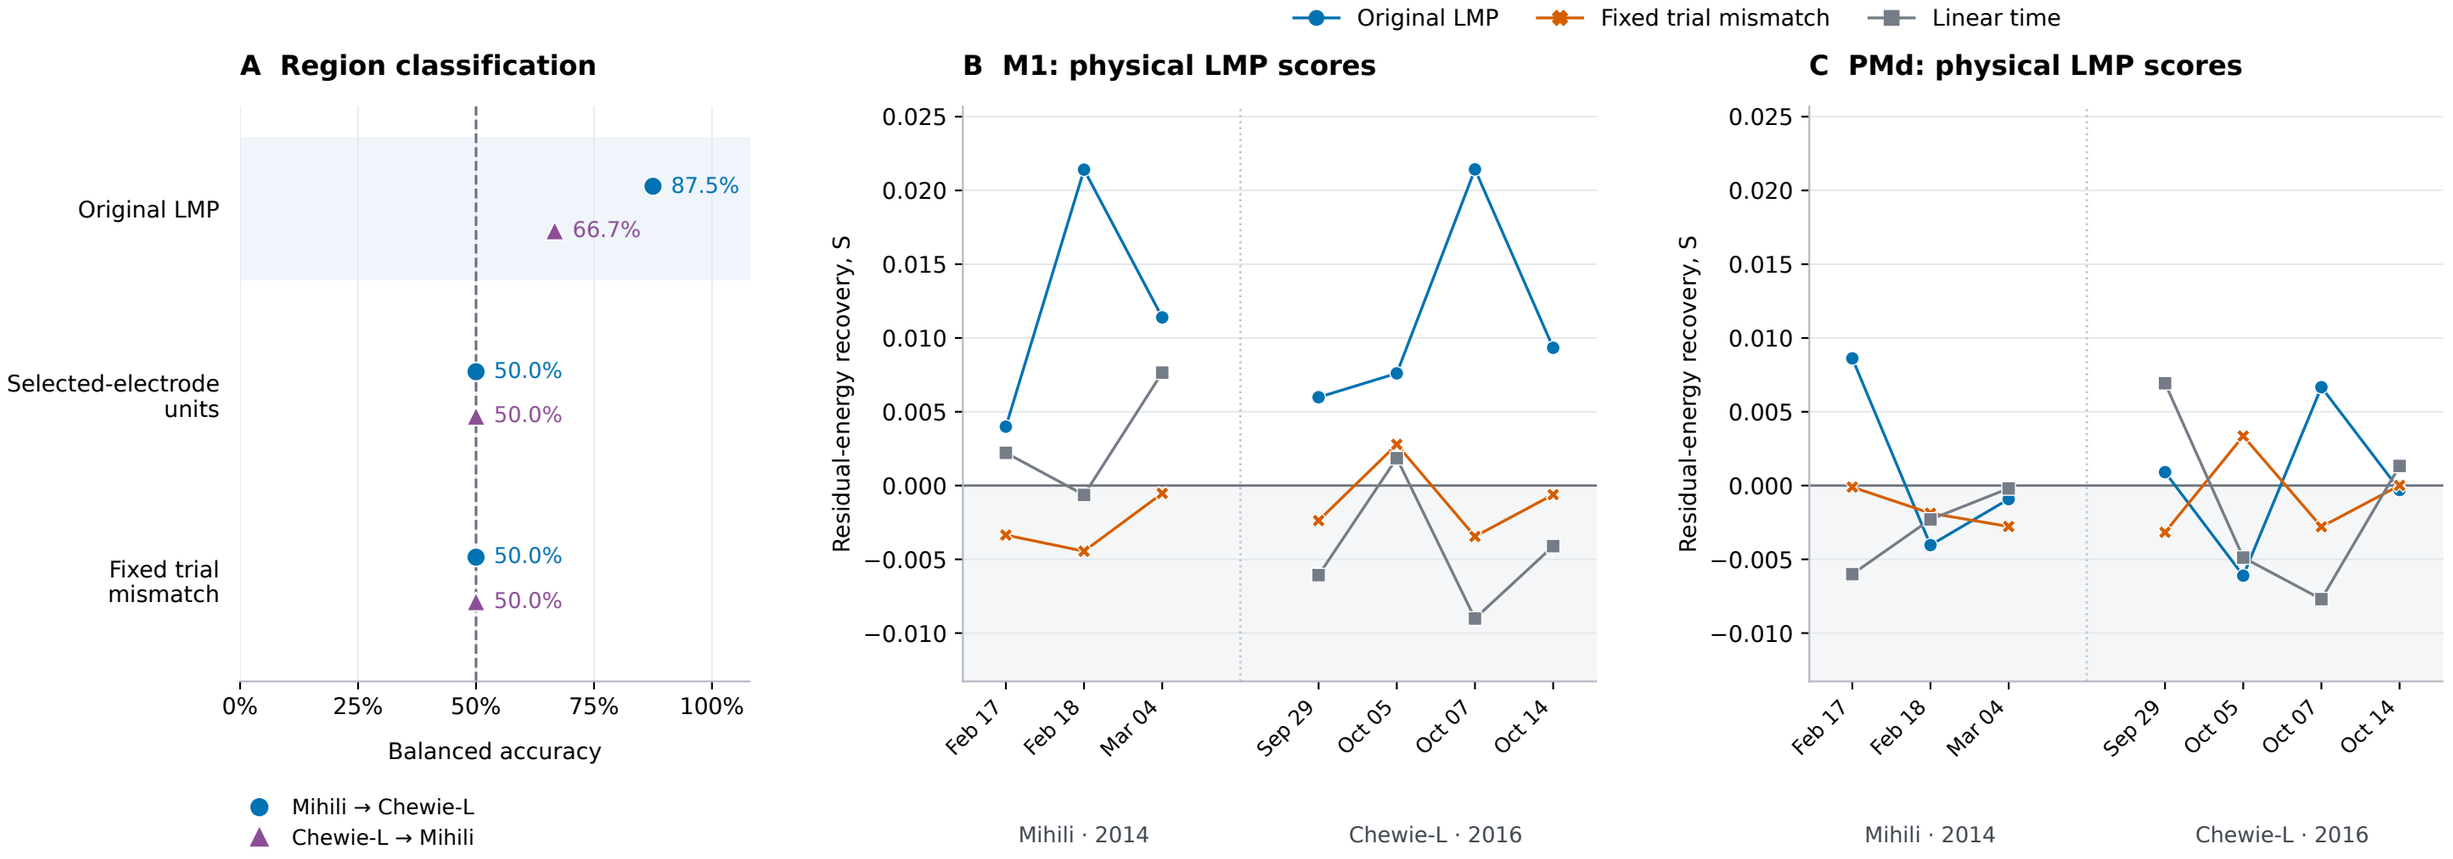
EP06: exploratory LMP signal; full study remains unsupported

Selected development comparisons | Seven paired sessions, two animals | Reserved outcomes remain closed



Original LMP passes raw signed-profile agreement, including all seven signed-profile omissions; selected-unit LMP fails.

LMP was chosen after 20 development comparisons. This is exploratory reuse, not independent confirmation or evidence for a multi-band fingerprint.
Selected units change the population basis. The mismatch is one fixed within-direction whole-trial permutation, not a p-value or a complete mechanism test.
Panels B–C use the original population basis for LMP, mismatch and linear time; S retains negative values. Paired regions and days are not additional animals.
Panel A's dashed 50% line is a chance reference, not a significance threshold. No new confidence intervals, tests, fits or scientific comparisons were added.
