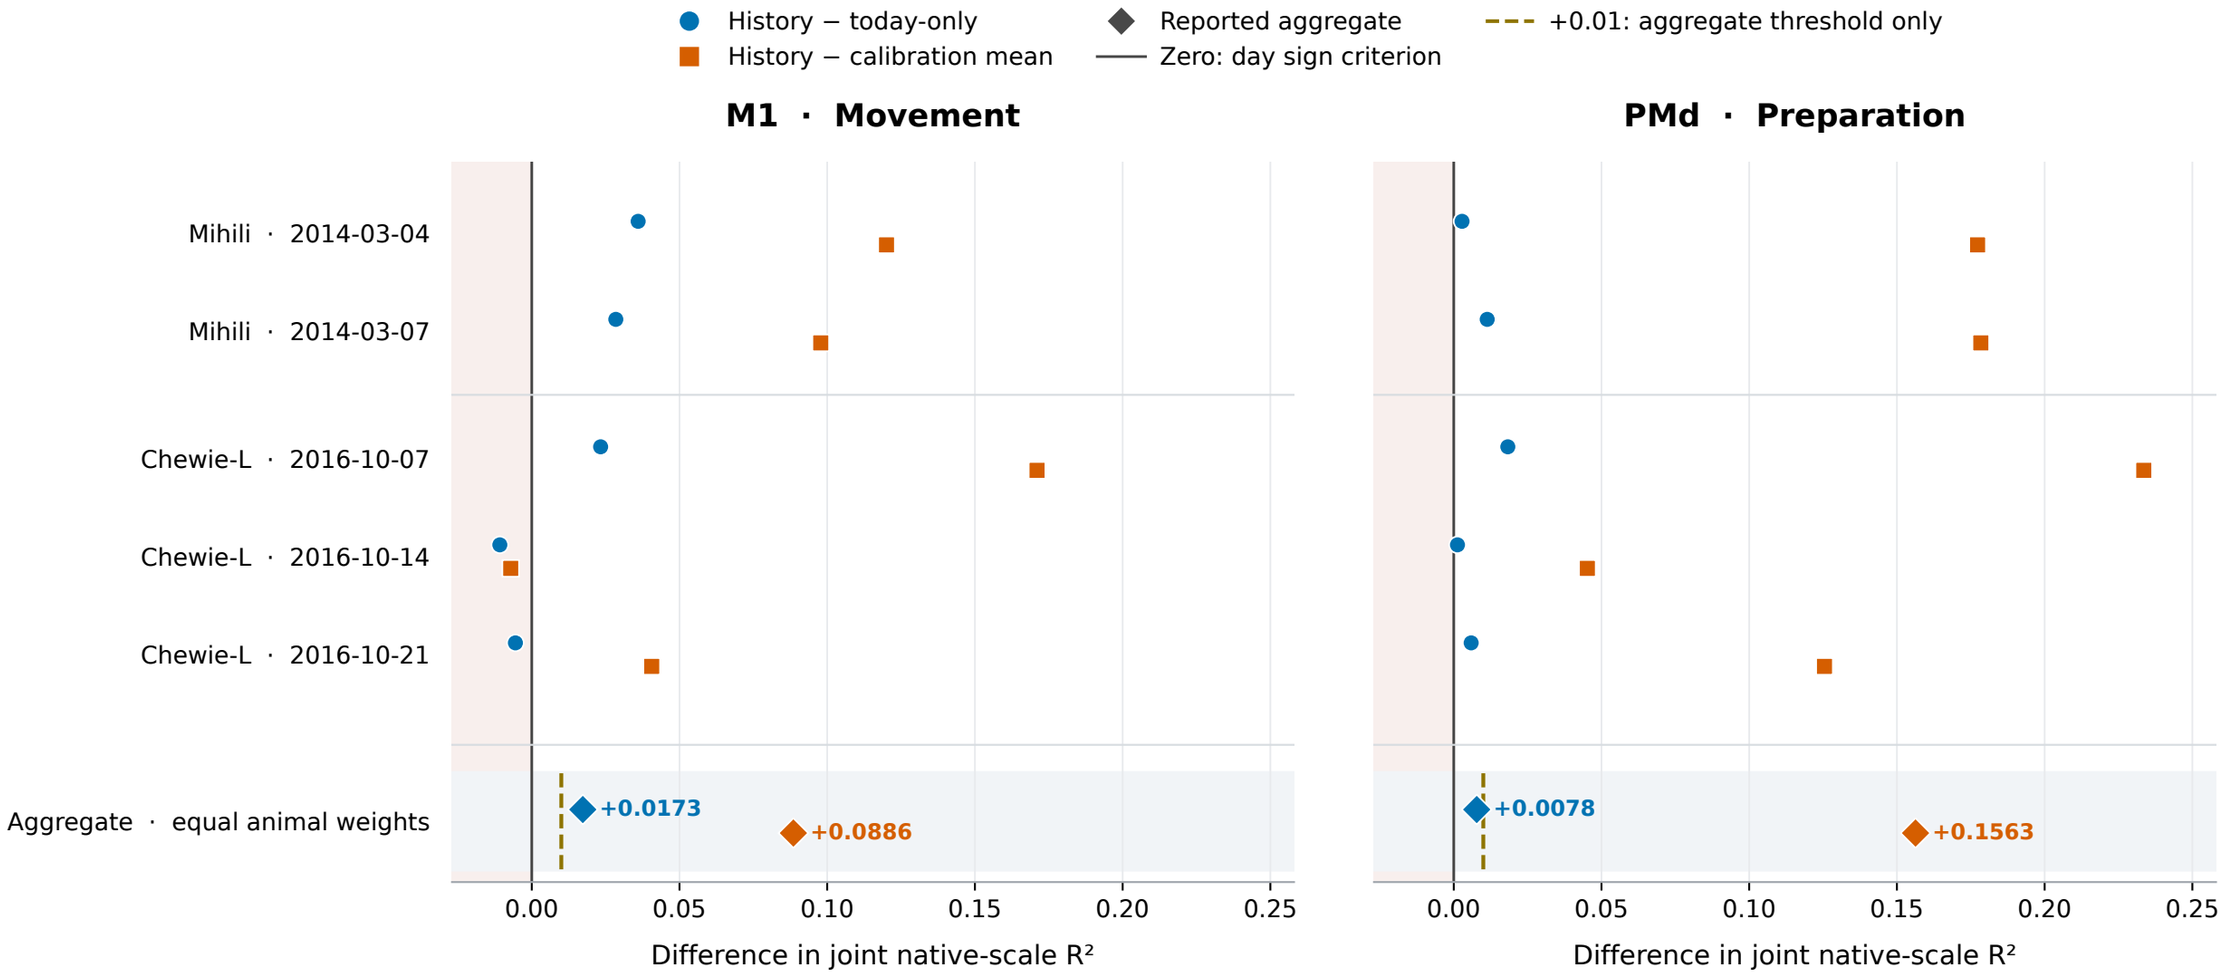
Neither region meets the full prespecified support rule

EP07 | Single completed primary evaluation | Five target days, two animals



M1: gains vary across Chewie days
Aggregate margin test passes (Holm p = 0.0004).
Chewie: 1/3 days positive versus both; at least 2/3 required.
The day criterion and the October 7 omission check fail.

PMd: improvement falls below the practical margin
Aggregate history − today-only = +0.0078 < +0.0100.
Aggregate margin test does not pass (Holm p = 0.9923).
The reported day-sign and omission checks pass.

Dots/squares are existing day estimates; diamonds are the existing aggregate: equal days within each animal, then equal animals.
Per-day requirements use zero; the +0.01 practical margin applies only to the aggregate. No new intervals or inference are calculated here.
Inference is conditional on five fixed days, two animals and fixed fits in a previously exposed public corpus. No trial-coupling claim.
