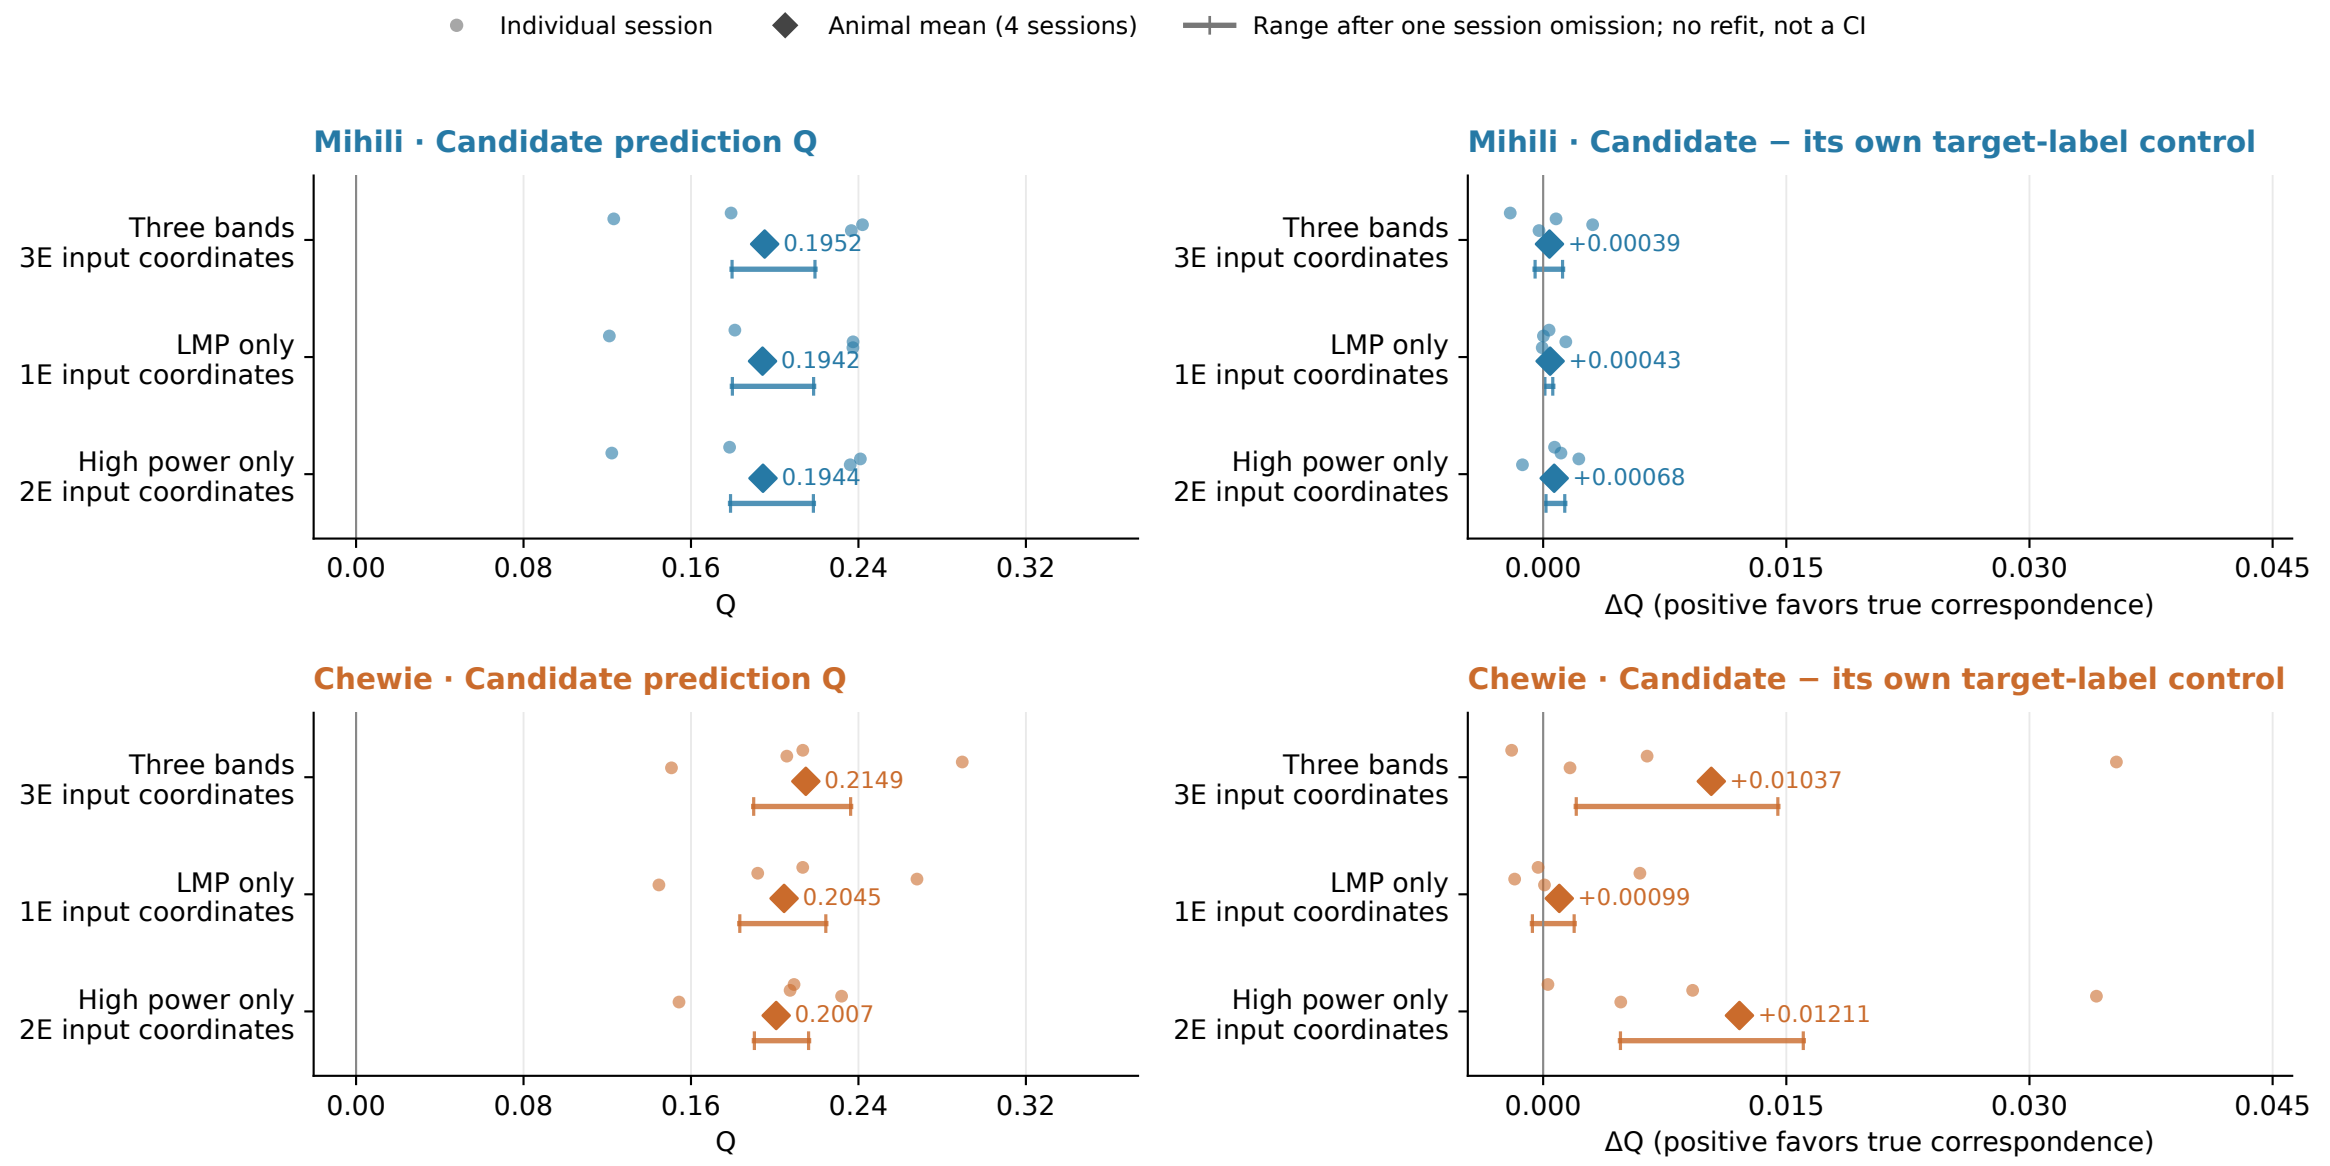
Spectral inputs: prediction and useful initializer correspondence

8 exposed development sessions · 2 animals · 20 equal-weight resource cells · 4 held sessions closed



Same physical electrode/trial budgets; actual acquired inputs are 3E, 1E and 2E. Information and model capacity differ across spectra.
Each ΔQ uses its own matched mean-five target-label control. All 96-electrode identity cells remain included.
Thin ranges describe all eight fixed-prediction session omissions; they are not uncertainty intervals. Session identities and values are in the CSV.
Mihili own-control positive screen changes after omission: Three bands.
Chewie own-control positive screen changes after omission: LMP only.
Exploratory sensitivity in two animals; no confidence interval, new-animal guarantee, spike-contamination or physiological-cause claim.
