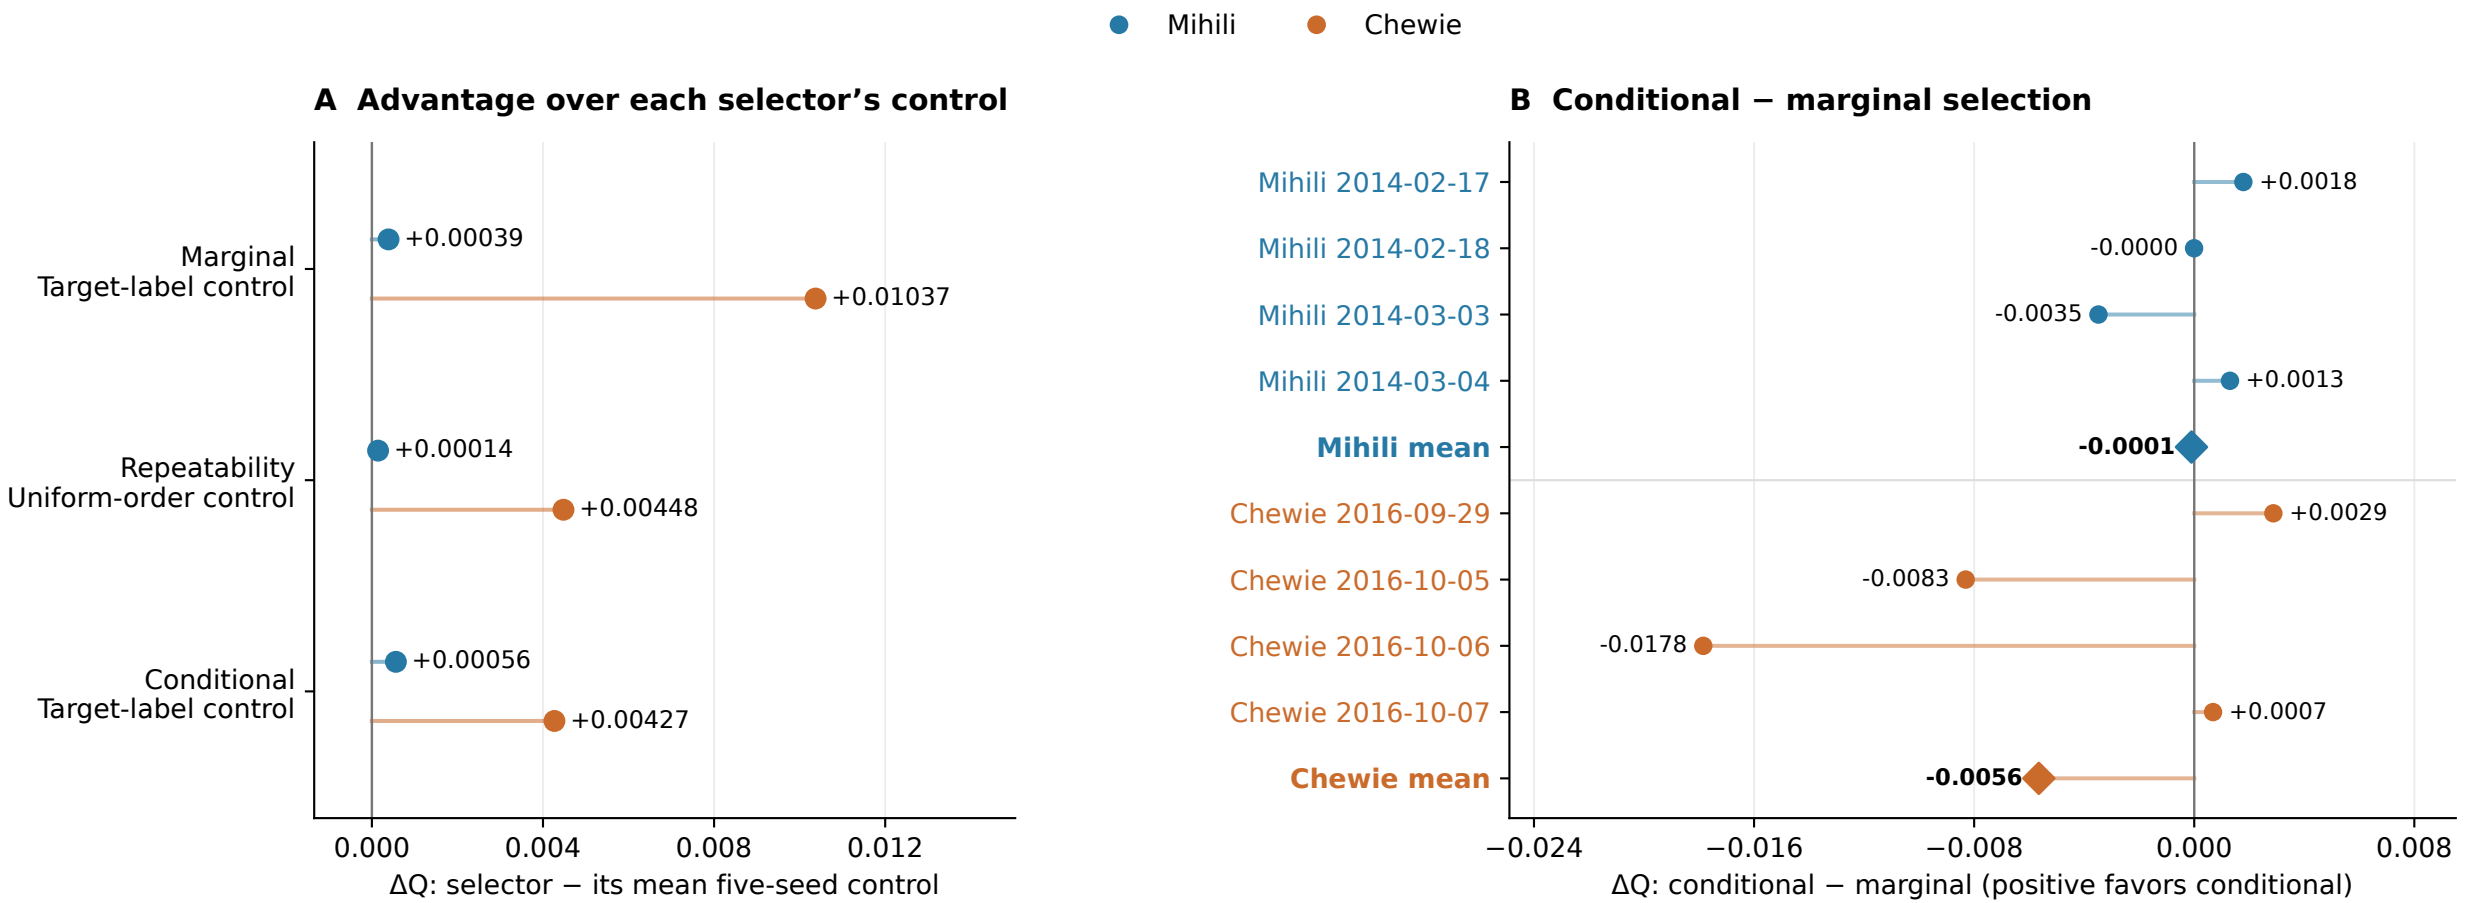
Initializer selectors: controls and the marginal incumbent

Exposed development · 2 animals · 20 equal-weight cells per session · 4 held sessions closed



Controls differ across selectors: target-label correspondence for marginal/conditional; uniform physical order for repeatability.
All 96-electrode identity cells remain included. Seeds and sessions are not additional animals; no confidence intervals or causal claim.
Conditional beats its own control in both animals after every fixed-prediction session omission.
Conditional remains below marginal in the equal-animal mean after every single-session omission.
Animal influence: Mihili changes sign without 2014-03-03.
