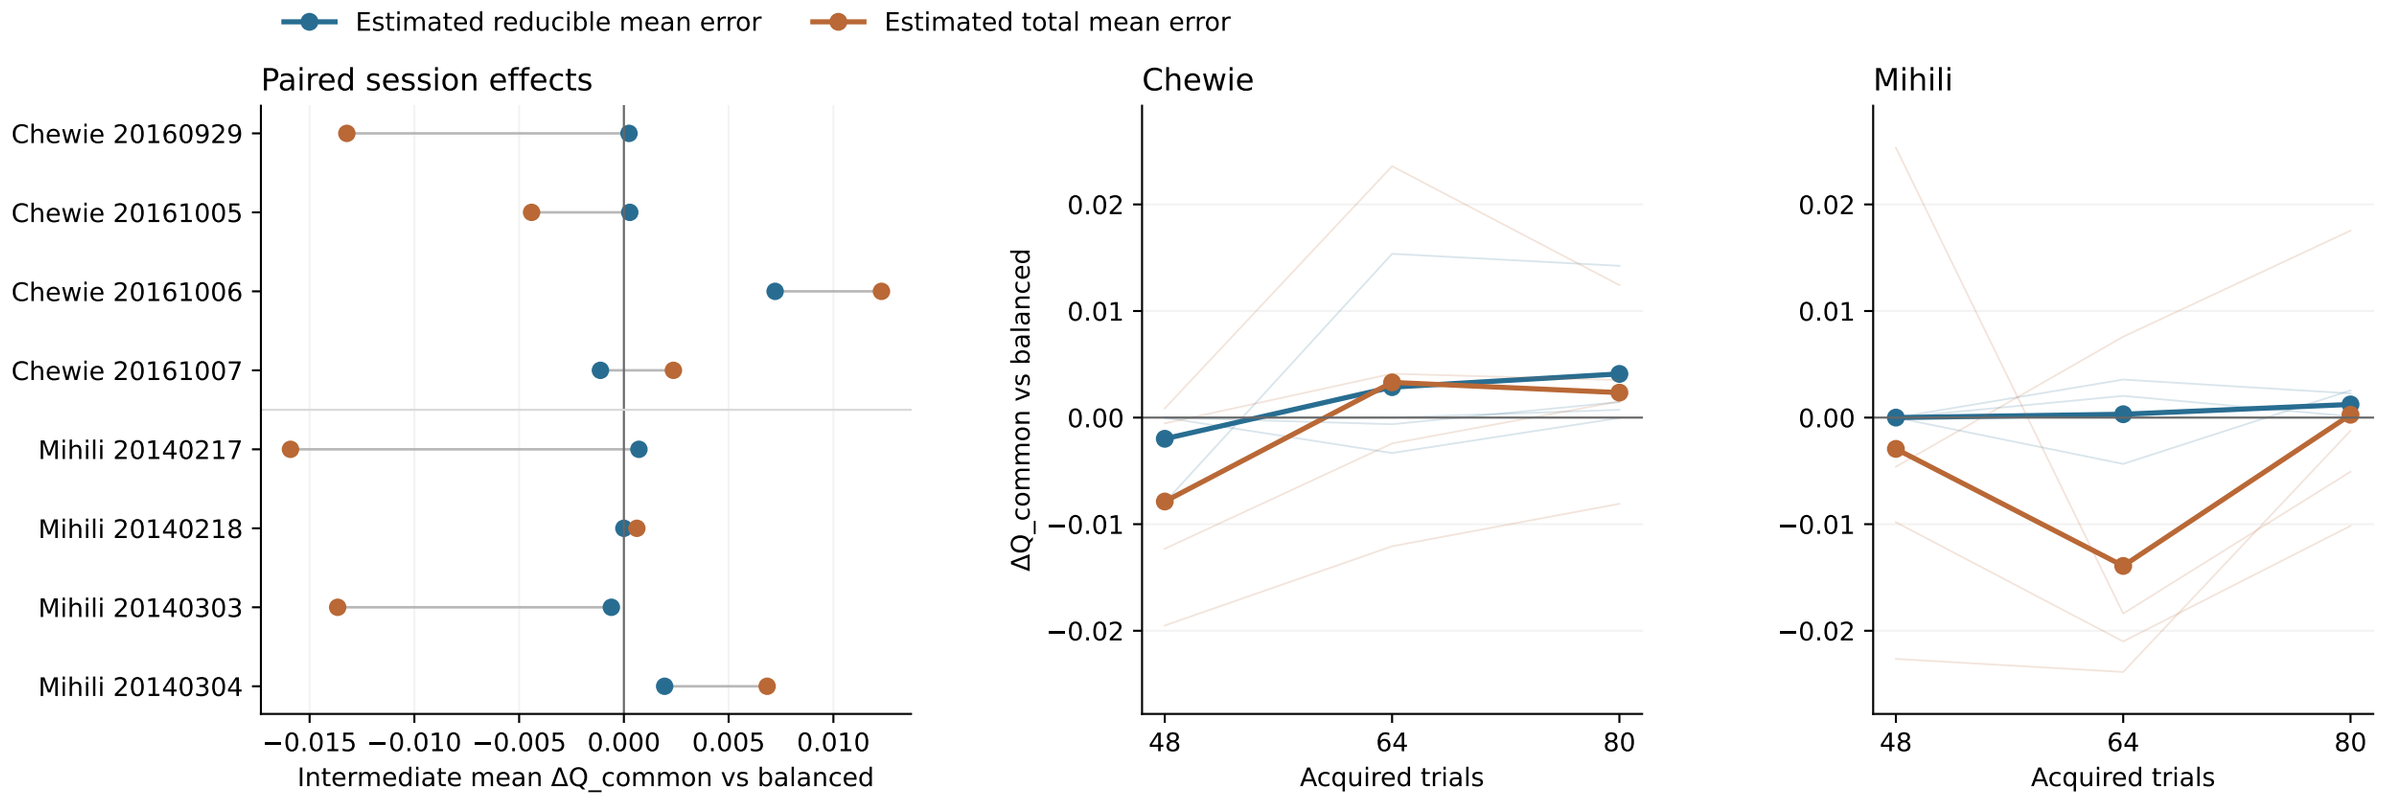
EP08 · Which next trial is useful?

Development only · fixed random electrodes · common initializer scoring · equal observations at each E,n



Intermediate = 48/64/80 trials × four electrode counts. Initial32 and final96 models are shared; their contrasts are exactly zero.

Left: each session's paired policy effects. Right: four-session animal means and faint session traces, averaging electrode counts. No CIs.

Utilities estimate direction-mean uncertainty/error, not full-decoder information gain. Four held sessions remain closed.
